

Using Panucci

April 18, 2017

1 What is Panucci?

Panucci is a network-based testing and imaging platform, with a goal of simplifying the workflow of a computer buildout operation to make a single-piece flow viable and productive.

2 Intended workflow

1. Gather empty units for orders
2. Grab a single unit
3. Install HDD and RAM into unit
4. Connect unit to server and input/output
5. Power on unit
6. Continue building and adding units as unit tests
7. Upon test completion, begin imaging
8. After imaging, verify correct boot
9. Send unit to shipping

3 Features

- Single workflow for all units
- Built-in partitioning and image creation
- Software allows for adding modular hardware
- HDD Testing (using `smartctl` and `seeker`)
 - Linear Write Speed
 - Linear Read Speed
 - SMART Short Self-Test
 - SMART Health Check
 - Random Seek Test
- RAM testing using `memtester`
- Automatic integration with SellerCloud using the `ScrubDeku` gem
- Support for label printing
- Basic logging, with upcoming support for a database logging system
- Used with `Seymour`, a script for creating a full image tree off of one image
- Simple interface built on CSS and HTML, allowing easy modification and updating

4 Basic Use

This section assumes you have already created a working PXE server for Panucci, and are able to boot into it. See document "Creating A PXE Server" for information on this. These instructions assume your existing setup followed the same basic setup as that detailed in "Creating a PXE Server".

4.1 Starting the server

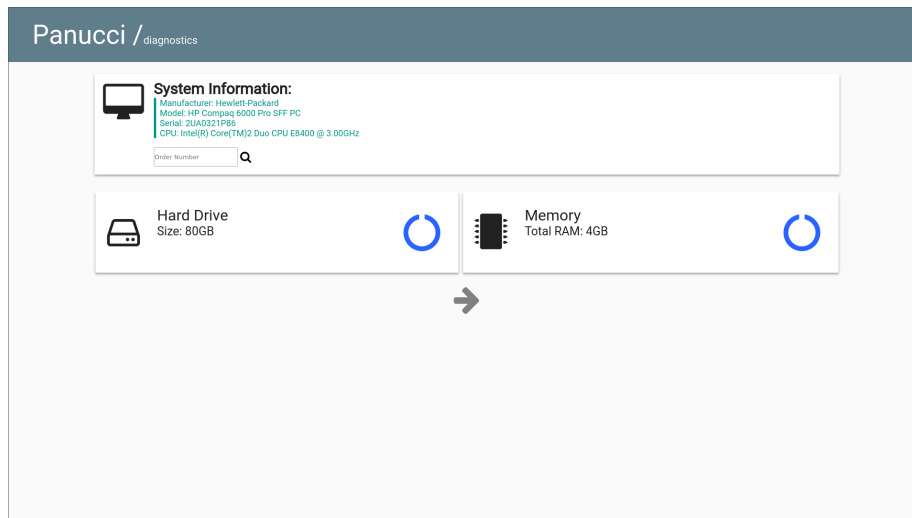

The server for Panucci can simply be powered on. As long as there are no errors, it will automatically begin serving up the needed files.

4.2 Booting Panucci

To begin using Panucci, after building out a unit with RAM and HDD, connect it to appropriate network port and power it on. Assuming a blank drive, network boot should be automatic as long as the unit supports it.

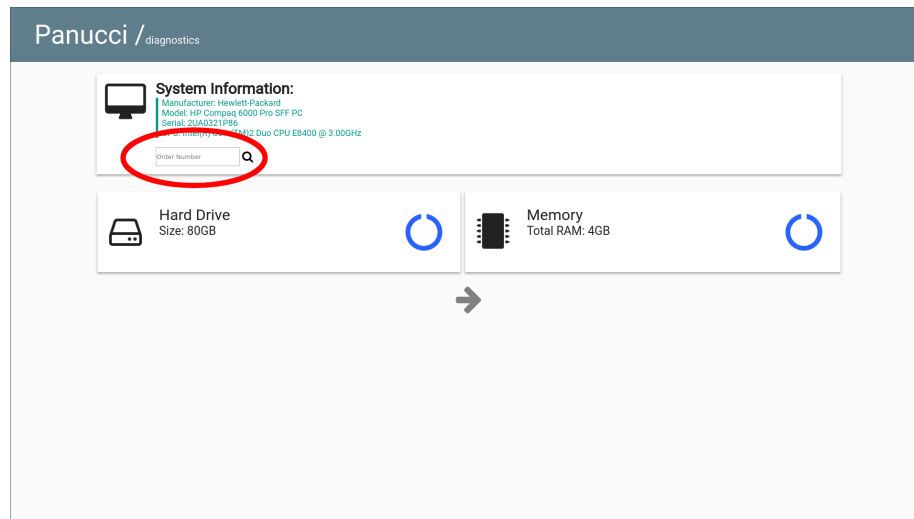

4.3 Testing in Panucci

Testing begins automatically on boot. Users can monitor testing on the displayed status.

4.4 Order Verification

Panucci supports order verification using SellerCloud. To verify an order, click inside the order number entry box.

After entering the order number, click the magnifying glass icon to search for the order. Orders with multiple computer kits will redirect to a page with all options; select the correct option to proceed.

After getting the order data, the testing page will contain the relevant order data, as well as visual indicators. **Green or Checkmarks** mean the unit matches the order; **Red or Xs** mean the unit does not match the order.

Panucci / diagnostics

System Information:
 Manufacturer: Hewlett-Packard
 Model: HP Compaq 6000 Pro SFF PC
 Serial: ZUA0321P86
 CPU: Intel(R) Core(TM)2 Duo CPU E8400 @ 3.00GHz
 Order Num: [REDACTED]

HP Z620 Workstation 2x Xeon E5-2603 1.8GHz 4GB 250GB Win 7 Pro 1 Yr Wty
 ✖Model: Z620 Workstation OS: Win7Pro ✖Proc: E5-2603

Hard Drive
 Size: 80GB
 Required: 250GB

Memory
 Total RAM: 4GB
 Required: 4GB

Hard drive does not match order

→

RAM matches order

In the above example, HDD capacity, Model, and Proc are all different from the order, as noted by the **red text and Xs**. Only the RAM matches, as noted by the **green text**.

4.5 Proceeding after success

After testing has completed, a label will print out, regardless of pass or fail. If the unit has passed, the green arrow at the bottom will become available:

Panucci / diagnostics

System Information:
 Manufacturer: Hewlett-Packard
 Model: HP Compaq 6000 Pro SFF PC
 Serial: ZUA0321P86
 CPU: Intel(R) Core(TM)2 Duo CPU E8400 @ 3.00GHz
 Order Number:

Hard Drive
 Size: 256GB

Memory
 Total RAM: 4GB

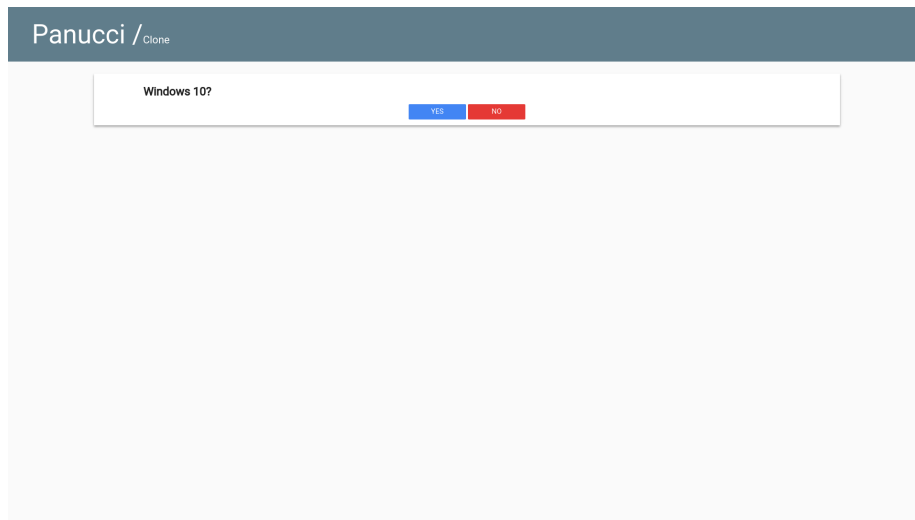

Click the green arrow to begin the imaging process. If the unit didn't pass all tests, fix the problems and re-test the machine.

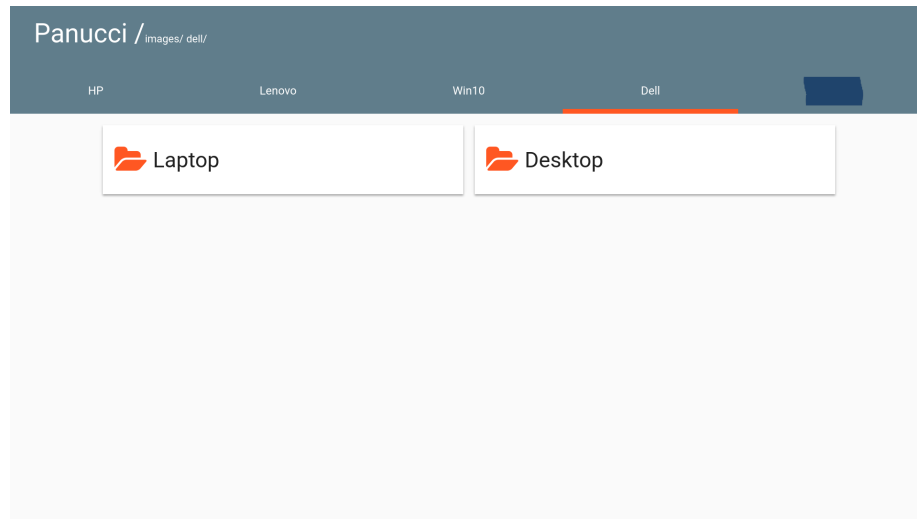

4.6 Imaging in Panucci

After testing is completed and clicking the green arrow to proceed, a prompt appears to see if the unit is to be imaged with Windows 10.

Clicking yes will immediately ask you to confirm to image with Windows 10, with the size detected by Panucci. Confirm to begin imaging with Windows 10.

If you select no, you will be taken to an image selection tree.

To navigate the tree, select a manufacturer at the top by clicking on it. Once a manufacturer has been selected, work through the tree by click on the appropriate label. Once a directory that contains images has been selected, Panucci will prompt to confirm imaging with the selected model and size. Confirm to image, deny to return to image selection.
